

IAX configuration

To get connected to aql's wholesale gateways, you would need to create the following in your `iax.conf` file:

```
[__username__]
type=user
context=iax-inbound
auth=md5
host=sip.aql.com
username=__username__
secret=__inbound_password__
trunk=yes

[aql-outbound]
type=peer
context=iax
auth=md5
host=sip.aql.com
username=__username__
secret=__outbound_password__
trunk=yes
```

Also, you'd need to place the following in your `extensions.conf` file (where `nnnnnn` is the VoIP ID for the particular inbound number you want to use):

```
[outbound]
exten => _X!,1,Set(CALLERID(num)=nnnnnn)
exten => _X!,2,Dial(IAX2/aql-outbound/${EXTEN})

[iax-inbound]
exten => nnnnnn,1,Dial(SIP/100)
```
